EDUCATION

California State Polytechnic University - Pomona May 2020

B.S. Computer Science GPA: 3.2

EXPERIENCE

Intel, Folsom, CA
Software Developer Intern November 2019 – May 2020

- Built an interactive web app using Flask and Bootstrap that showcases performance advantages of Intel Optane Memory. Resulted in a partnership with a Major Company to model their distributed storage system with the optimal configuration of Intel SSD's.
- Added a feature to an internal Intel web app that allows users to download graphs by rasterizing the SVG's generated by D3.js to .PNG format. Implemented in Angular.js.
- Developed a plugin to automatically provision any Python version and their necessary dependencies onto air-gapped servers.
- Implemented Angular data bindings to update title pages dynamically based on page content and a feature to hide and show columns of a grid, greatly improving its usability.

Automation Engineering Intern May 2019 – November 2019

- Created a development plan for employing machine learning to detect faulty SSD firmware using TensorFlow, MongoDB, and Docker. Architected database schema that indexes SSD performance metrics.
- Wrote a framework using Python that provisions and deploys Intel SSDs, saving over 25 employee-hours per week.
- Resolved firmware issues and created unit tests to assess code base performance and validate components in software.
- Followed agile methodologies under two-week sprints to distribute story points amongst team members, increasing responsiveness to unexpected changes of requirements.

Printronix AutoID, Brea, CA February 2018 – August 2018
Software Engineering Intern

- Designed and developed a metrics aggregator for thermal printers to quickly analyze performance fluctuations resulting from feature changes. Written in Perl.
- Refactored schema of thermal output data for enhanced analysis and readability.

Cal Poly, Pomona, CA - Professor Hao Ji July 2017 – January 2018
Machine Learning Research Intern

- Created a convolutional neural network to develop a real-time facial recognition system that detects expressions of drowsiness. Implemented using Python and TensorFlow.

PROJECTS

Project Manager of Machine Learning Team A.I. Project

- Developed Speech-to-text (STT) and Text-to-speech (TTS) systems with TensorFlow to create a voice assistant that interprets verbal commands and performs various tasks. Used a LSTM (Long Short-Term Memory) RNN for SST/TTS and a low-pass filter to isolate speech from background noise.
- Directed two orthogonally positioned teams to meet project goals. Tracked team activity utilizing Gantt charts and organized weekly standup meetings.

Event Calendar Web Service

- Developed an event calendar web service with MEAN stack (MongoDB, Express, Angular JS and Node.js).
- Held weekly scrum meetings, managed development cycles of project, and used GitHub Issues to organize features and bugs.

SKILLS

- *Languages:* Python, Java, Go, C++, JavaScript, HTML and CSS, Perl
- *Technologies:* Linux, Bash, PostgresSQL, MySQL, MongoDB, Docker, Git, Gitlab, MakeFiles, Quickbuild, CI/CD, React, Angular.js, Express, Node.js, Bootstrap, Postman
